33 GUs (or 28 if Creoles are considered 'non-genetic[ally classifiable])

132 languages (or 127) = .25 GI or (= .22)

436.5 = 3.31 or (419/127 = 3.3)

GUs: Arawakan, Uto-Aztecan, Cariban, Tucanoan, Arutani-Sape, Maku, Mayan, Guahiban, Choco, Tupi-Guarani, Coconucan, Salivan, Misumalpan, Chibchan, Yanomam, Camsá!, Tinigua!, Lenca!, Warao!, Tol!, Paez!, Puinave!, Pumé/Yaruro!, Yarí/Yurí!, Amikoana*, Iapama*, Kohorixitari*, Yuwana*, [+Aukan, +Kwinti, +Palenquero, +Saramaccan, +Sranan]

+ Creole * Unclassified ! Isolate

I think I am now leaning towards considering Creole languages out of the calculations for the genetic index but not the endangerment index, so .22 GI and 3.31 EI

(this is like walks/bases on balls in baseball, which count for slugging percentage and runs batted in but not as at-bats for batting average)
